

Microbit Robotics Beginner Level 2

Lesson 3

Moving Basket

Presented by Advanced Superlogic Team

Today's Topic

- 1. Build a Moving Basket with World of Modules**
- 2. Infrared and Button programming**
- 3. Loops programming**
- 4. Servo programming**

Learning Outcome

- 1. Able to build Moving Basket with instruction manual**
- 2. Understand Loops programming**
- 3. Understand Servo programming work**
- 4. Able to program Interactive Box**

Lets build Moving Basket

Please make sure that the wiper shaft is installed **correctly**, as shown below.

Wire Connection

Connect the modules

Let's **connect** the module like this.

10 Points

Connect the modules

Let's **connect** the module like this.

MakeCode Programming

<https://github.com/YahboomTechnology/Module-World>.

And

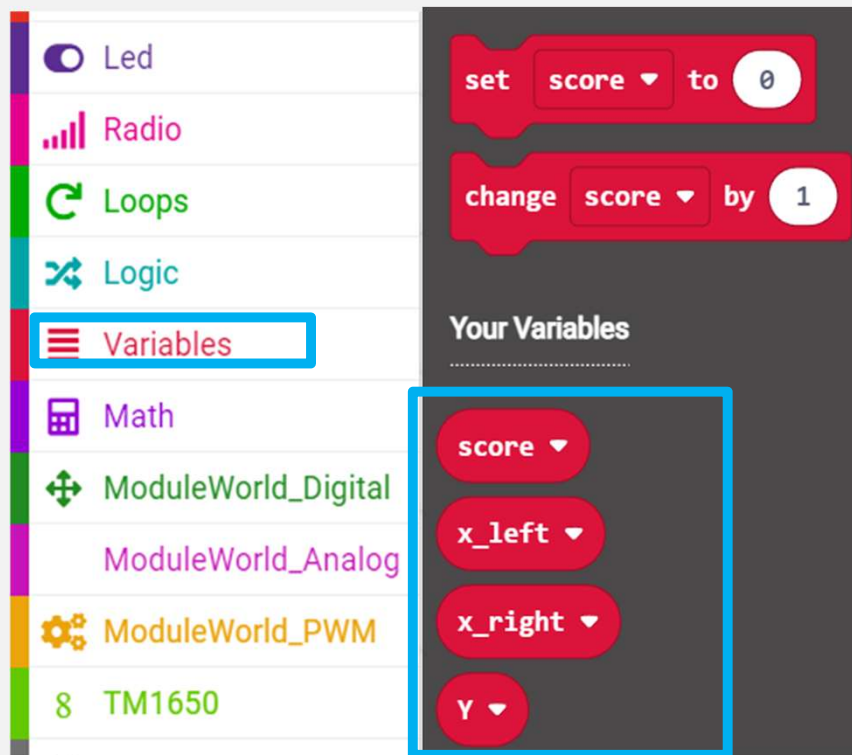

<https://github.com/YahboomTechnology/tm1650>

Or search [YahboomTechnology/Module-World](https://github.com/YahboomTechnology/Module-World) in the extension block

Coding – Loops

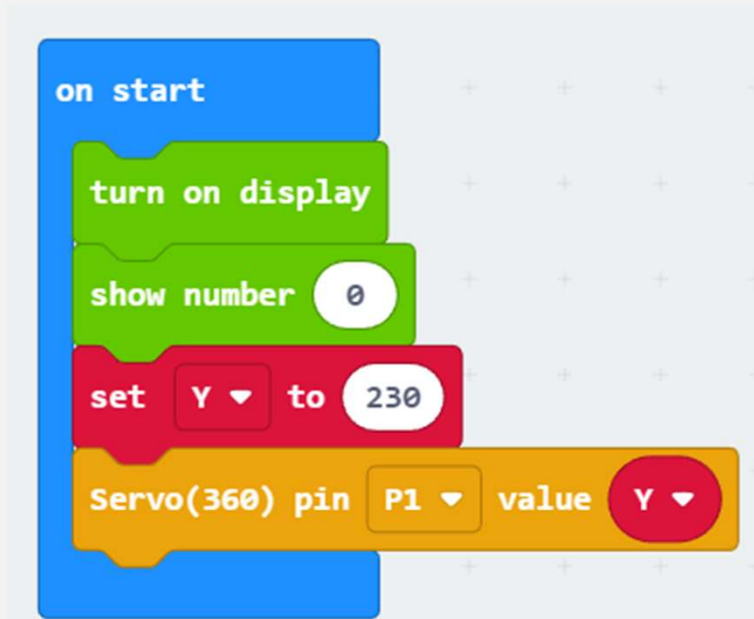

Coding – Variables

We will need 4 variables for this model, let's create:

- Score (for recording score)
- x_left (for indexing in a for loop)
- x_right (for indexing in a for loop)
- Y (position of the servo)

Coding – On start

Let's set a variable called "Y" to 230.

For our servo starting point we make it to go to 230°.

Coding – forever

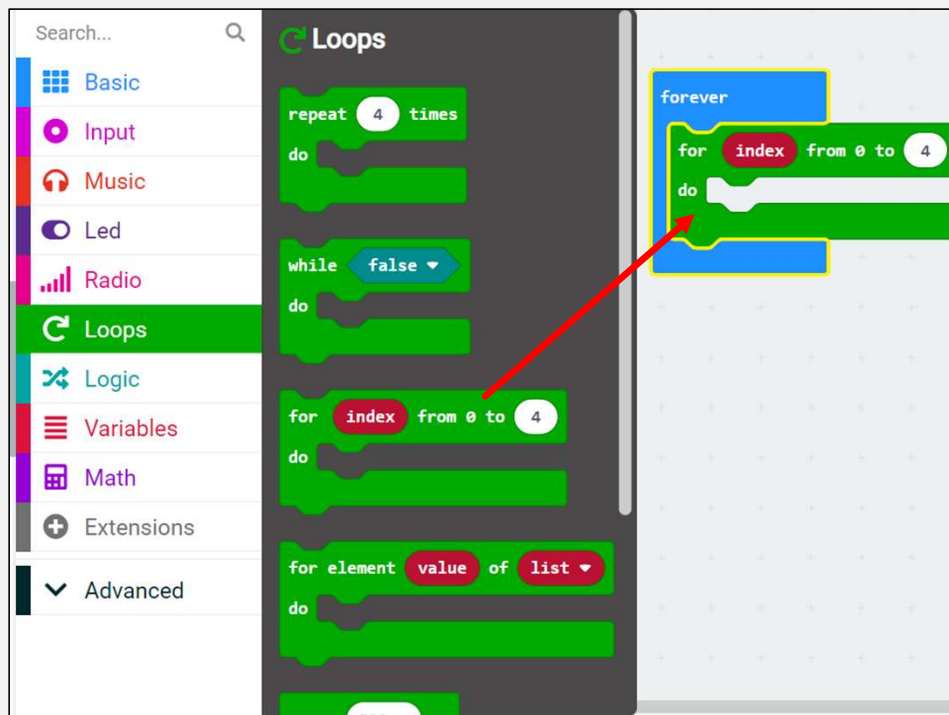

```

forever
  if IR pin P2P3 value Obstacle then
    show string "SCORE"
  
```

When a ball is successfully dropped in the basket, it will trigger the Infrared sensor.

Once the Infrared sensor senses the any obstacle (when ball goes in basket), then the digital tube will show a string "Score".

Coding – forever

Drag a for loop from the loop category to the forever loop.

This for loop means how many loops you want to repeat for the action, the default is 0 to 4, which means the action inside will be done 5 times, which are 0, 1, 2, 3, 4.

The index will store the number of the loop that is running currently. (*if the loop is being run in 3rd time, the index is equal to 2)

Coding – forever

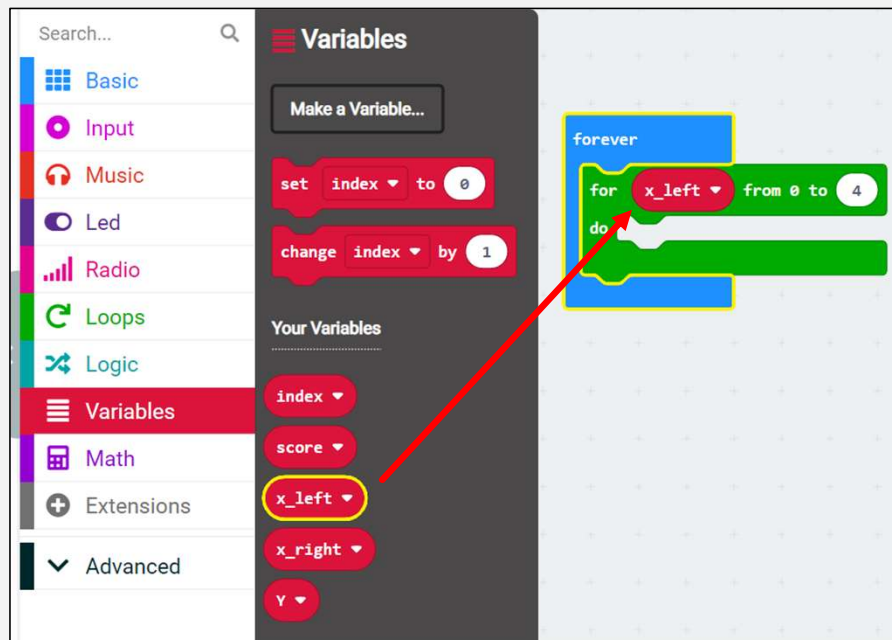

index

Running
loop

There might be confusing in the index here, because the index is starting from 0, so the first time running in loop the index is 0, the second run the index will change to 1, so and so on.

Coding – forever

To not making ourselves confused, we will use our variable “x_left” instead of “index”, because we need to make the basket move to the left and also come back to the right, so we will need 2 for loops here.

Let’s replace the “index” with “x_left” from our variable.

Coding – Making basket move

Position of
servo = 230°

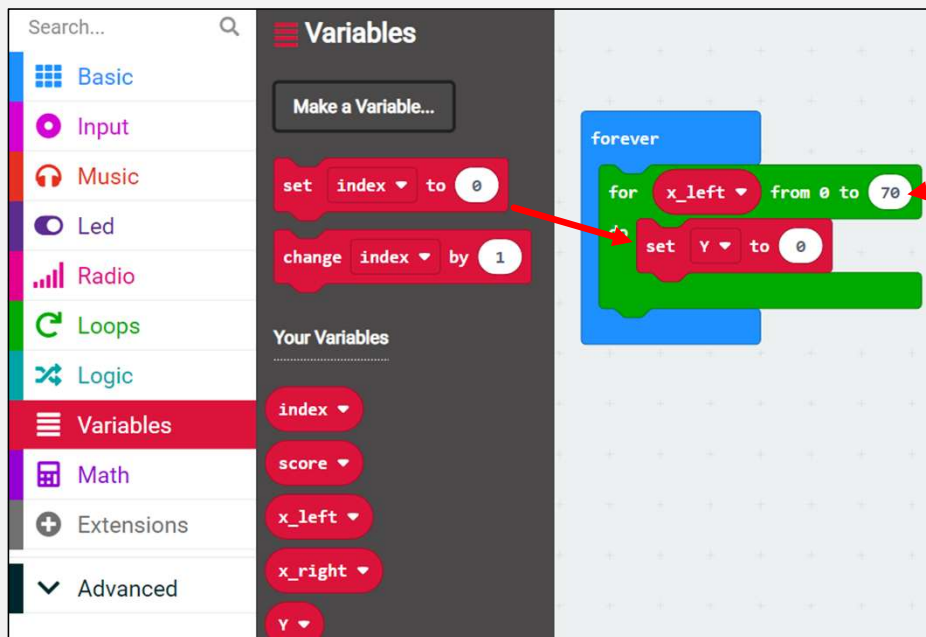

Position of
servo = 160°

Since our basket need to move from right to left.

At the most left, our servo position is at 230° while we need to go to the most right with the position of 160°, so with a difference of 70°.

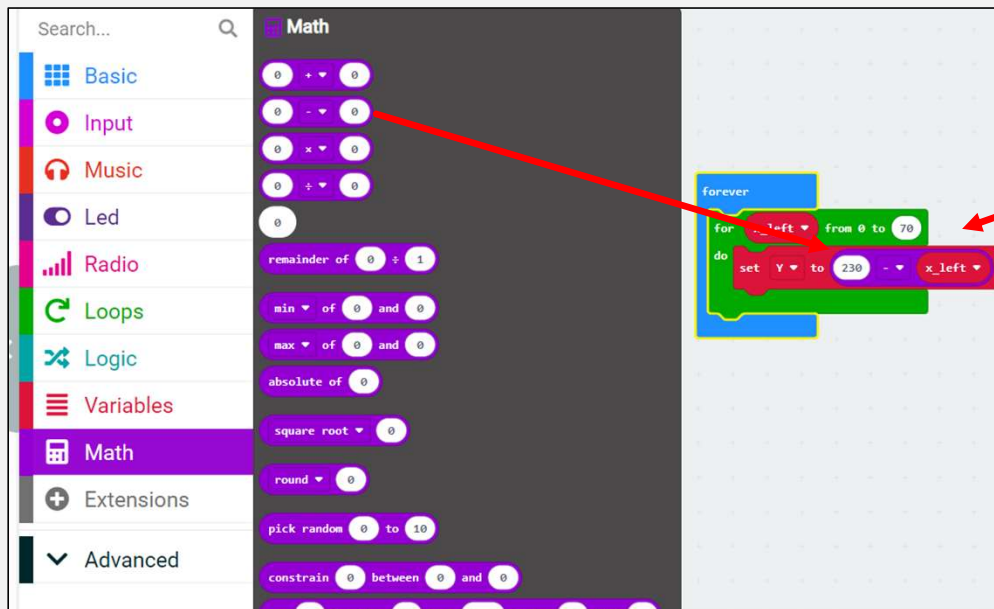

Coding – forever

So we need to loop for 70 times so that the servo can keep reducing from 230° to 160°.

We will use “Y” to store the target position of our servo to be moved to, so we need a “Set Y to ___ “ block in the for loop.

Coding – forever

And now we need to do calculation here, each loop run, it will increase the “x_left” by 1, and the servo position should be reduced by 1 for each loop until the last loop (where x_left = 70), the “Y” position should reach 160°.

So we set an equation for servo position calculation to $Y = 230^\circ - x_left$

Coding – forever

```

forever
  for x_left from 0 to 70
  do
    set Y to 230 - x_left
  
```

This is how the loop will run.

Y 230 → 229 → 228 → ... → 162 → 161 → 160

x_left 0 → 1 → 2 → ... → 68 → 69 → 70

Coding – forever

```

forever
  for x_left from 0 to 70
  do
    set Y to 230 - x_left
    Servo(360) pin P1 value Y
    pause (ms) 30
  
```

Then we will ask the servo to go to the position “Y”, and pause a 30 millisecond for every loop run (the longer waiting time will make the basket move slower)

Coding – forever

```

forever
  for x_left from 0 to 70
  do
    set Y to 230 - x_left
    Servo(360) pin P1 value Y
    pause (ms) 30
  for x_right from 0 to 70
  do
    set Y to x_right + 160
    Servo(360) pin P1 value Y
    pause (ms) 30
  
```

Duplicate the for loop for basket to move to the left, and place it after the x_left loop.

This is to move back to the right side, so we will change the index to x_right.

And equation is adding back the position from 160° to 230°, so we need to set the Y equation to $Y = x_right + 160^\circ$

Coding - Overview

```
on start
  turn on display
  show number 0
  set Y to 0
  Servo(360) pin P1 value Y
```

```
forever
  if IR pin P2P3 value Obstacle then
    show string "SCORE"
```

```
forever
  for x_left from 0 to 70
  do
    set Y to 230 - x_left
    Servo(360) pin P1 value Y
    pause (ms) 30
  for x_right from 0 to 70
  do
    set Y to x_right + 160
    Servo(360) pin P1 value Y
    pause (ms) 30
```

Phenomenon

After the program is downloaded successfully.
The servo **controls** the basket to move cyclically **left** and **right**.
If you **throw** the ball in the basket, there will be a corresponding prompt **sound**, and the digital tube will **display "score"**.

30 Points

CHALLENGE

for : Lesson 4

L4 – Challenge 1

Can you demonstrate the program and explain how to program works?

1. Explain what for loop is.
2. What is variable and why do we use variable in this program?

30 Points

L4 – Challenge 2

After the program is downloaded successfully.

If you throw the ball in the basket, the buzzer will play the “ba ding” sound, and the digital tube will **count up by 1**.

30 Points

L4 – Challenge 3

After the program is downloaded successfully.

If you **press** the button, Micro:bit board will **displays** “√”, the moving basket will start to **add speed**, increasing the difficulty of shooting.

30 Points

L4 – Mission

After the program is downloaded successfully.
 Increase the difficulty of shooting when the **score increases**.
 The **button** module may act as a **reset** button.

Example: When the score is **5**, make the basket move **faster**,
 and when the **score is 10**, the basket will move even **faster**.

50 Points
